Strawberry Plants

That Grow

1890 1916

C.E. Whitten's Nurseries
Bridgman :: :: Michigan
The Fall-bearing Progressive

This is the one really "Fall-Bearing" variety, as this sort will bear a heavy crop during the Fall months on plants set the previous April.

Other varieties will bear a few berries the first Fall, but you must wait until the following year for a crop, and then if you let the plants bear the June crop, as they will unless disbudded, they are so exhausted that the Fall crop is much smaller than the Progressive gives the first season.

I claim that the Progressive grown for the on... season's crop, that is, set a new bed each year, will pay better than to grow the other sorts that you have to wait a year for your returns.

Superb is really the only sort in this class that can be considered as competing with the Progressive, and altho it is a larger berry, it will not stand shipment as well the latter. As a June variety it does excel, but why pay the price when we have so many better June sorts. I am not knocking the Superb, for we are growing plants of that variety to sell, I give it as my honest opinion of the comparative merits of the two varieties, considered as Fall croppers, from personal experience.

We have grown the two varieties side by side for past three years, 1913-14-15, and have picked crates from the Progressive where we did not pick small from the Superb, during the Fall. We find that it pays to have the soil well enriched where growing the Fall-bearers, and also that constant cultivation is essential. This may make sandy berries if it is rainy weather, but is necessary if you wish to grow a profitable crop, as you must have the new growth for your later berries.

I know the public generally is skeptical regarding Fall-bearing Strawberries, and doubt the stories we are trying to tell; for myself, "I had to be shown" before I would take hold, and I am very glad that I waited until the Progressive was introduced, for I feel sure that it is the most successful of all the Fall varieties yet produced.

This variety was originated by Harlow Rockhill of Iowa, and introduced by C. N. Flanningslough of this state, from whom we obtained our original stock, and we guarantee our plants the true Progressive.

There is not near the acreage of this variety grown for plants as of Superb, and with an increased demand from all sections I feel quite sure that we will be sold short long before the close of the shipping season, and would urge all to place their orders early.

Price will probably hold about the same as last year. See inside pages for further description and prices.
GREETING

AGAIN we are greeting our old friends and prospective new ones through this our Annual Booklet, "Strawberry Plants that Grow."

We wish to thank our old customers for their continued patronage and while we cannot say that "our trade doubled" last year nor that it was "best season we ever had," we do not believe this was from any dissatisfaction on the part of our old friends, but we lay it to the season and to "general conditions" over which we had no control.

In fact, our trade was hardly up to the average last year, but we were not alone, for others who were honest admitted this same falling off.

The past season was so very "moist" that plant growth has been excellent except in very low or poorly drained fields.

Generally speaking we have a very fine stock of most varieties and our plants have made an extra strong growth.

We are situated in southwestern Michigan, near the lake in the heart of the "Great Fruit Belt of Michigan."

For over thirty years we have been growing Strawberries in this same location and feel that this experience should in a measure qualify us as an authority on Strawberry culture, though we do not claim to "know it all."

We have always tried to do a Square and Honest business and hope to continue the standard.

We make no claims for the great superiority of our plants, but we do claim that we grow just as good plants as anyone else can. Neither do we claim to be the "largest grower," but feel that this is to the advantage of our customers, as we are able to oversee personally both the culture and shipping of all stock which we send out, which is impossible where the "largest business" is done and much has to be left for others to look after.

We do not claim infallibility and sometimes mistakes occur. We are always ready to correct these if reported at once.

We take great pains to keep our plants true to name, and warrant them as such, and if any prove untrue, will either refund the money paid or replace with those which are true.

We cannot warrant plants to grow, for there are too many chances over which we have no control; we do warrant our plants to be packed to carry safely and to be in good growing condition when delivered to the carriers, after which our responsibility ceases.

Our strawberry plants are all fresh dug at time of shipping, as we do not try to winter any in cellar.

I wish to emphasize this statement, as in the past some have claimed that my plants have been held over winter in cellar. Let me say here that I never did this, nor have I ever seen others that practiced such methods.

In propagating strawberry plants for sale we always set from one-year-old beds which have not fruited. We also set different varieties in blocks of several rows each, thereby obviating the danger of mixture, liable where different sorts are set in alternate rows. In digging, we usually take up the entire row, discarding the original plants and such of the tip plants as are not well rooted, therefore, we have no exhausted stock to send out.

In digging strawberry plants our help work in the field when the weather is fit, lifting the plants with "potato hooks" when taking the plants from the soil, stripping off the surplus leaves and runners and tying in neat bunches of twenty-five (we always aim to put in twenty-six.) After tying, the bunch is carefully heeled in until the required number of that variety is dug, thus the roots are not exposed to the air for any length of time.

Of course, sometimes our packages get broken in transit, through careless handling, and if found in such condition upon delivery, our patrons should refuse to accept and pay charges upon the same, if once accepted it is hard to collect damages. Also if plants have been delayed and have been an unreasonable length of time on the road, do not accept them, as they are quite liable to be injured, especially strawberry plants.

It will be a great help to me if my friends will speak a good word for my plants, if they have the opportunity, and it will be thoroughly appreciated.

More than one catalog is received, please hand to some one whom you think will be interested in small fruits.

Please read very carefully our "Instructions to Purchasers" on page nineteen before making out your order, also be sure and use the Order Sheet enclosed, writing post-office, county and state very plainly.

Please sign your name plainly; we can guess at anything else easier than proper names.
How to Set and Grow Strawberries

The Soil and location best adapted to strawberry culture vary somewhat in different sections. In a general way we have said that any soil that would grow corn or potatoes would grow good strawberries, and this would be a pretty safe rule, it is also true that in order to grow them to the best advantage it is necessary to have the soil properly adapted. One of the first requisites of the ripening fruit is moisture, and care is provided. Hence if the soil is dry or loose, sandy soil would not be a safe location, although in moist seasons a fair crop might be harvested. Notice how necessary it is to have the soil thoroughly dug, and no hard frost will suffer more than on sandy soil. It would seem that a sandy loam or loam with slight mixture of clay seems to suit the best.

Drainage—Having chosen a soil retentive of moisture, it next becomes necessary to prepare for proper drainage. In case of excessive rainfall, unless the natural lay of the land is such that no water will stand upon the surface, the only practicable use is to dig a trench or ditch to carry it off. Open ditches will, perhaps, answer this purpose, but are unsatisfactory in many ways.

Manuring—Where the soil is at all deficient in fertility, very little, if any, stable manure should be used. If this can be applied to the soil the previous year and some cultivated or hoed crop grown, then the following season the land must be in the best possible condition for setting strawberries.

Fitting the Soil—Begin by plowing as late in the fall as possible before the ground freezes. This late plow will fit the ground well and mark the row to be set by. This will make the work much easier. Plow and loosen the soil so that frost will act upon it more readily, also leaving it in a condition to retain moisture in the earth which may be drawn upon later in the season in case of drought. It also tends to kill a great many insects which would otherwise be almost sure to do the greater portion of the plants set.

Fitting the soil should be thoroughly harrowed, followed immediately with a heavy roller or plank drag. This firming of the soil is important as it is almost impossible to set plants properly if the soil is not reasonably level and firm at the surface. If the surface soil should become too dry and loose it would be necessary to wait for a shower before setting the plants.

Marking Out—This may be done in any manner that will fit the ground, shallow, or deep, to cover the crown or heart of the plant; the latter will cause the fruit to be more nearly perfect, also to preserve moisture if the weather is dry, by forming a pocket below the fruit to keep it cool. This cultivation should be kept up throughout the season, never allowing the surface to crust.

Cultivation—As soon as setting as practical, the surface soil should be stirred very shallow, being careful not to disturb the roots. As soon as the first light frost appears cover the crown and heart of the plant with a good, strong pressure of the foot, being careful to see that the opening is entirely closed that air may not enter and dry out the roots.

The greatest pains should be taken in getting the plants into the soil, and in this respect the hands of your most careful workmen, or better still, do this part yourself. The best time to do the work is when the shallow basket or other receptacle, with the roots moistened—if the roots are very long they should be cut back and thinned or sprfy. The plant should be set by the upper part of the crown, and placed in the opening made at about the same depth it grew, which would bring the crown even with the surface; now let the operator press the soil firmly against the plant with a good, strong pressure of the foot, being careful to see that the opening is entirely closed that air may not enter and dry out the roots.

All runners should be cut off until the first of July, which if needed to be covered may be placed in a very good heap. The Half Mattoe Root should be set in the ground one-half foot apart and eighteen to twenty-four inches in the row. The rows will be opened, the fruit being a very good size. The Middle Mattoe Root should be started in the middle of summer, then allowed to root until row is about one foot wide, after this all runners should be cut off. This gives a fine crop, the rows being from four to five feet apart in the first season, and six feet in the second.

The Mattoe Root is the system adopted by the great majority of the growers, although without doubt other methods would prove equally successful. The rows are set four to four and one-half feet apart, and plants from twenty to thirty inches in the row. The runners are all allowed to run, running the cultivator always in the same line, and the extra runners not required. At times, if the season happens to be favorable, and a few runners will do, and the soil is rich, almost the entire surface will be covered with plants. This method might be applied on poor soil where fewer plants would be grown, or with varieties that make few plants.

Setting Out—We use a common garden spade for opening the holes, which is done just ahead of the setting, not leaving them to dry out. In doing this the operator proceeds along the row, thrusting the spade in the center of the mark already laid out, spacing equal distances according to the width of the plant, and so close if to be grown in hills, and further if for matted row.

The depth should be nearly the depth of the spade, and if the soil in properly prepared this will not require much effort, but if the soil should be very solid, it will require some pressure of the foot. The spade should be given a slight motion away from you back towards the operator, when withdrawn, if the conditions are right, the soil will open with good and proper opening which will readily receive the roots of the plant. Care should be taken to not get the back and forth too much, as this tends to open too wide a space at the bottom of the hole, making it hard to close properly, and leave a chance for air space, causing plants to dry out and die.

The greatest pains should be taken in getting the plants into the soil, and in this respect the hands of your most careful workmen, or better still, do this part yourself. The best time to do the work is when the shallow basket or other receptacle, with the roots moistened—if the roots are very long they should be cut back and thinned or sprfy. The plant should be set by the upper part of the crown, and placed in the opening made at about the same depth it grew, which would bring the crown even with the surface; now let the operator press the soil firmly against the plant with a good, strong pressure of the foot, being careful to see that the opening is entirely closed that air may not enter and dry out the roots.

Cultivation—As soon as setting as practical, the surface soil should be stirred very shallow, being careful not to disturb the roots. As soon as the first light frost appears cover the crown and heart of the plant with a good, strong pressure of the foot, being careful to see that the opening is entirely closed that air may not enter and dry out the roots.

The greatest pains should be taken in getting the plants into the soil, and in this respect the hands of your most careful workmen, or better still, do this part yourself. The best time to do the work is when the shallow basket or other receptacle, with the roots moistened—if the roots are very long they should be cut back and thinned or sprfy. The plant should be set by the upper part of the crown, and placed in the opening made at about the same depth it grew, which would bring the crown even with the surface; now let the operator press the soil firmly against the plant with a good, strong pressure of the foot, being careful to see that the opening is entirely closed that air may not enter and dry out the roots.
Fall-Bearing Strawberries

Fall-bearing Strawberries have become so well known at this time that most people recognize them as a distinct species; however, we oftentimes hear some one say, "Oh, yes, my Dunlap, or my Breed, had a fall crop this season." Of course this sometimes happens, but it is quite a different thing from the regular fall-bearing varieties.

We have mentioned in earlier Catalogs how Samuel Cooper of New York found the first fall-bearing strawberry plant away back in 1898. This he named Pan American in honor of the Buffalo Exposition. From this variety and its seedlings have sprung all the fall-bearing sorts in America today.

**Progressive**

(Per.) This variety is conceded by all growers who have tested it to be the best fall-cropper. By this I mean that it will bear more berries the first year of setting than any other we list. This year we have picked and shipped to the Chicago market since August 24th very nearly 100 sixteen-quart crates of berries from our block of Progressives set in April, 1915.

One of the strong points of this sort is that the new runners begin bearing as soon as rooted, in fact, many will have fruit buds and blossoms showing before the plant has taken root. Therefore it is a mistake to grow the Progressive in "hills," as in this manner the plants bear so heavily that they exhaust themselves and the berries run too small.

The fall-bearers require a soil of good fertility, if not naturally rich, then add fertilizer; we find nothing better for this than well rotted stable manure worked into the soil during the fall previous to setting in the spring. Then, too, cultivation must be continued until the close of the growing season if you would have best success. This constant cultivation will make dirty berries in rainy season, but is necessary if you want the best growth of fruit and plants.

We find that Progressive is the best shipper, holding up for long distance shipping, equal to almost any of the June sorts, and in flavor and quality is equal to or surpasses any of the fall-bearers that we have tested.

We made our last shipment this fall on November 5th, after we had bad storms and quite hard freezing. We picked enough good ripe berries for the table on Thanksgiving day and could have picked several quarts if we had gone over the entire field.

Our prices have not been quite so high as last year, ranging from $2.00 to $4.50 per 16-quart crate. We have had more competition, as more are growing the fall-bearers each year.

I do not hesitate to urge all to try these berries, for I know you will be pleased. Some of our friends seem to be afraid that they will not succeed with them, but any one that can grow the June sorts successfully can grow these. The only difference in culture is that you must keep the bloom picked off until July 15th or August 1st for best results.

Twelve-five, 75c; hundred, $2.00; thousand, $15.00.

**Superb**

(Per.) Some call this the best of the fall bearers, but I give it second place, considered commercially, for the reason that the Progressive bears so many more berries the first season.

However, Superb is a good berry and will bear a heavy crop of fine berries in June of the second year and if given right treatment, by which I mean clean culture and extra fertilization, it will begin ripening another crop in August and continue until covered with snow, or destroyed by hard freezing, the first frosts do not injure it much, as the fruit is mostly underneath the foliage.

Superb is the larger berry, but does not stand up for long distance shipping so well as Progressive, especially in very hot weather. However, as a home berry or for near market it is fine, and where space is limited as it usually is in town, or city homes, this is an ideal variety to grow, giving, as it does, nice ripe berries from June to Thanksgiving.

We have a reproduction of Superb in color on the front cover of this catalogue, but it is much reduced in size, about one-half.

Twelve-five, 60c; hundred, $1.50; thousand, $12.00.
"COLLINS"

The New Strawberry Which Will Make Bridgman Famous

We have a colored half-tone of this new Strawberry on the back cover of this Catalog, which shows very nicely the productiveness, general form, and appearance of the variety, but can not do justice to its beauty, as we are not able to give the exact shading or color.

Beneath the reproduction we have described the origin of this new berry, and in continuation would say that we have been rather unfortunate in the matter of the introduction of this new variety, as Mr. Collins sold out his little farm here and moved to Illinois in the fall of 1911.

He reserved the plants growing on the place and in the spring of 1912 I took up all the new plants and sent to him in Illinois, keeping a dozen or so here for further testing, also keeping the original hills, or “mother” plants until after fruiting. It was from these original plants that we picked the cluster of berries for our photo.

Mr. Collins prized this seedling berry very highly and at first thought to be able to put it on the market himself, but after moving to his new location he concluded that his soil was not adapted to plant raising; still he has been able to grow fine berries and has topped the market with the “Collins” the past two seasons.

This new variety has been only indifferently tested at several of the State Experimental Stations. After fruiting it this season, Mr. Bailey of the Illinois Station, writes as follows:

“The Collins berry is firm and has the characteristics of a good shipper, with some tendency to run irregular shape on first pickings. A decidedly acid berry but of good quality. Outside of this irregularity of first pickings and its failure to measure up in yield with some of our standard says, I believe this is a very desirable commercial berry. The plant characteristics of Collins are practically faultless.”

Our Michigan Station writes:

“Collins Seedling has behaved with us this year much as it has with you; it seems a very heavy vine producer, and as these runners were not kept back as much as they should have been, the berries were somewhat small. They bore quite heavily, however, and were rather late although injured some by frost early in the season. The fruit stems are tall and strong, bearing the berries well up from the ground.”

The Ohio Station writes that their trial test plot was practically destroyed by white grubs so they could make no report on the comparative qualities of this variety.

We had a block of this variety left for fruiting the past season which had been covered with a lot of strawy manure for winter protection, this covering was left on, except where too thick, it was raked between the rows. We had severe frosts late in May, and this seemed to strike harder where we had the plants covered with the manure so that this block that promised so well and was apparently in full bloom seemed to be wiped out. However, in a few days these plants began to throw out new fruit stems and we finally harvested a good crop, making some very heavy pickings from these rows. This variety continued in bearing fully as late in the season as any variety that we had, picking the last good berries after Aroma and Sample were finished.

Owing to our rows having set too thickly, the berries were not as large as usual, but ran very uniform in size, there being few if any really small berries. Some call this variety “sour,” but to me it is only pleasantly tart and of such good rich flavor that we consider it fine to use either in fresh state or canned.

It is also of such firmness and solid texture that we were able to ship in good shape to the Chicago market while only picking twice a week. I am sure that the Collins will be a great commercial berry when growers become acquainted with its good qualities, and I would urge all to test it on their own ground.

We are offering it this season with no restriction, and as we sold only a very few plants last year no one else will have the genuine “Collins” for sale in any large amount. Best buy of the introducer and be sure of your stock. Twenty-five, 50c; hundred, $1.50; thousand, $10.00.

A Few Words of Appreciation

Marion, Ind., April 24, 1915.

Dear Sir,—The Strawberry plants ordered from you were received in good condition and were the finest ones I ever bought any place, and you have made a happy customer and a friend to you. When the plants came the ground was too wet to set them out and I had to wait a few days. After setting out it was dry and warm for over a week and I was afraid to look at them. For past few days we have had some warm showers. Today I watered through the patch and out of the 400 plants set out there were exactly 400 growing fine; I am well pleased with them.

Yours truly,

OTTO E. ROOKER.

Tamaqua, April 26, 1915.

Dear Sir,—In regard to the plants I received them on the 19th and they were all O. K. They were the finest plants I ever received.

Yours truly,

I. M. SCHOCK.

Ellis, Kan., April 22, 1915.

Dear Sir,—Received the plants all O. K.; everything all right; all growing nicely.

Yours truly,

H. M. HALLOCK.

Dear Sir,—Your Strawberry plants received April 24. They are great. Thanks for the extra ones. Truly yours,

C. B. FISH.

Dear Sir,—Regarding order 276 excuse delay in letting you know the shipment arrived. It was delayed five days at the local office through some misunderstanding. Everything is O. K. Thank you very much for the Strawberry plants. They are the best I have seen. Anything I can swing your way will certainly do so. Yours truly,

PAUL POVENZ.
All Strawberry blossoms are either staminate—also called perfect—, or pistillate, generally called imperfect.

The Imperfect varieties, which are all male (Imp.) in catalog, should have a perfect variety, marked (Per.) set every third or fourth row to properly pollenize the blossoms of the imperfect sorts.

There seems to be a mistaken idea with some that this mixing of varieties is necessary with the perfect as well as the imperfect sorts; but this is not so. The perfect sorts are self-pollenizing, and will bear as well if set by themselves.

**NEWER VARIETIES**

**Big Joe Johnson**

(Per.)—A new variety from Maryland, which gives promise of becoming one of the best late market sorts. Below are descriptions taken from some of the Maryland growers' catalog:

"This new berry originated in the southern part of Wicomico county, Maryland, about four years ago, and has been well tested. It ripens about the same time as the Chesapeake. The Joe Johnson is very productive of very large berries. It is a beautiful red berry with a bright green calyx, which adds greatly to its beauty and market value. Flavor is of the best; a perfect table and canning berry, and one of the best shipping varieties. Has a perfect flowered blossom and is a strong pollenizer. You will make no mistake in planting the Joe Johnson."

"This is a new variety that is being grown to considerable extent locally in this county, and has sprung into prominence very quickly. It has been fruited in this section two seasons, and it has shown such vigorous growth and such a wonderful productiveness of large, handsome berries that bring top prices in market that everybody who has seen it is wanting plants."

We dug all of this variety last spring except a very few plants at the end of one row, which were given no attention. However, these berries ripened quite late, were of good size, bright red color, and very firm. I think that with proper treatment and on good soil they are bound to be a great market berry. The growth of plant is very near "ideal." While it is not a heavy runner, it makes a good row of strong, bright and healthy looking plants. Its season of ripening is among the latest, and I am sure it is destined to become one of our best late market varieties.

We have only a limited stock of plants to offer this season, but shall make the price reasonable. Twenty-five, 20 cents; hundred, 60 cents; thousand, $4.00.

**Chesapeake**

(Per.)—This comparatively new variety I have received from the introducer, W. F. Allen, of Maryland, whose description is as follows:

"This variety is as late as the Gandy, and more productive; furthermore, it will thrive and bear an elegant crop on soil entirely too light to produce good Gandy berries. It is equal to the Gandy in size, superior to it in firmness, red shipping qualities, and in eating qualities the Gandy is no comparison. In flavor it ranks with William Belt, Brunette and others of that class.

Therefore, in the Chesapeake we have attained to a greater degree than in any other variety, three of the strongest points that go to make up a valuable commercial berry—these are firmness, quality and lateness. When these good points are added to the fact that it is of uniformly large size, very attractive in appearance, and being one of the most healthy and vigorous growers, puts it nearer perfection than has yet been reached by any other berry, and I can conscientiously say that if it succeeds in other sections as it does here, it is the best strawberry in the world today."

This has proven to be one of the very best late berries that I have ever tried, but as it makes only a few strong plants it is not profitable for the plant grower.

This year we have quite a fair stock of Chesapeake plants of our own growing and shall make the price very reasonable. Twenty-five, 20 cents; hundred, 60 cents; thousand, $4.00.
The Famous Gibson

(Per.)—This is not the old variety of that name which originated in Eastern New York several years ago, but it is a local berry of great promise and more nearly resembles the Pocomoke than any of the older sorts which I am acquainted with.

It commences to ripen with the second early and continues for a long season, making a heavy yield of fruit.

The fruit stems are large and strong, and the dark green foliage is an ample protection for the blossoms and fruit; having a strong staminate bloom, it makes a very good pollenizer for pistillate varieties.

The berry is large and regular in shape, holding its size well to the end of the season; its color is a deep, rich red all through from surface to center; its flavor is fine, being neither too sweet nor too sour, but just right for table or canning.

In manner of plant growth it very closely resembles Pocomoke, making a heavy row of very strong and healthy plants, its foliage being of a very dark and glossy green, not a speck of rust to be seen on our rows this season.

It is very hardy in bud and bloom, withstanding spring frosts that very nearly wiped out such varieties as Beder Wood and Warfield on adjoining rows.

I cannot give the parentage of the Gibson, neither can I give its exact origin, but it seems to have originated in our county (Berrien), having been grown by a colony of German farmers who kept it to themselves for several seasons, making big money out of it. Finally it became known and other growers have been able to fruit it until at the present time it has become very popular with our market growers.

The above is taken from our earliest description and I still think it is one of the best market sorts we list.

It seems identical with Pocomoke and hereafter I shall list only the one sort. This should not prejudice anyone against this variety, as under either name you will find a first-class berry.

I would urge all my friends to try it and I feel sure you will not miss it if you plant largely for market or for the home garden. Twenty-five, 20 cents; hundred, 60 cents; thousand, $5.50.

Rewastico

(Per.)—This is another seederling from Maryland, and the introducer claims a rival of Chesa-peake, which he also introduced.

Not having seen the Rewastico in fruit I will give Mr. Allen's description:

"The Rewastico is a highly colored, large, cardinal-red berry, and the color penetrates through and through; it is very productive, and in size is uniformly large; in shape it is as perfect and uniform as if turned out of a mould. In plant-growth it is one of the healthiest on the farm, making plenty of large, strong plants, with an abundance of vigorous, luxuriant, dark green foliage; in quality it is rich, with an aromatic Strawberry flavor, though somewhat tart; but is firm enough to be very popular as a market berry. We consider ourselves extremely fortunate in being able to procure the entire stock, and are glad to be able to offer this new berry this season at a price within the reach of everybody, as it is so good and is going to be so valuable as a market berry that we want all of our customers to have it. We sincerely believe that those who fail to procure plants at the very reasonable price at which we are offering them this spring will miss a great chance to get started with one of the best market Strawberries ever offered to the public. We consider it the only real competitor that the Chesa-peake has ever had, and in some respects it even surpasses that exceedingly popular variety. Anticipating a great demand, we shall plant heavily of it ourselves; and should we misjudge it in the demand for plants, we are sure we shall not be disappointed, weather permitting, in a large crop of fancy berries. We can give no stronger recommendation than this, and we know our friends will be as highly pleased with it as we are."

Our block of this variety, altho on rather low land which has been too wet the past season for best results, have made good rows of strong and healthy appearing plants.

I am confident that this is to be a great acquisition to our list of new varieties, and would advise all who are looking for something better in the line of late market sorts to give this a trial. Twenty-five, 25 cents; hundred, 75 cents; thousand, $5.00.
Billy Sunday

(Per.)—This new variety was originated on the farm of Mr. Yost, in the state of Ohio, from whom I have received plants for our own setting. Not having seen this in bearing I can only give the originator's description, which follows:

"I have been growing small fruits for fifteen years and have fruitied nearly all standard varieties of strawberries, but haven't found any that will take the place of this new variety, that originated on my fruit farm seven years ago. I named it the 'Billy Sunday.'

"Many have made inquiries and came to my farm at fruiting time to see these large, sweet berries. The plants are very hearty—a great crown maker—tall, dark green foliage, long, heavy fruit stalks, making the berries easily gathered. The berries are very large, glossy red, slightly wedge shape, uniform in shape and size, a delicious, sweet flavor and it ought to be a good shipper. They fruit a long season, throw out late bloom that develops larger berries, making a frost-resister. They begin to ripen with Haverland and end with Sample. A perfect flowering variety and a good plant maker.

"The Billy Sunday berry is independent of the common market varieties. There was never a time when good berries would not command a premium over the common market grade. I have a big trade with these berries here, and haven't grown enough yet to supply my trade at 15 cents per quart. The Billy Sunday variety has been tested by people whom you know to be reliable. Therefore the following letters from Experiment Stations are proof of my statement:"

Mr. Yost:
Dear Sir,—The Billy Sunday strawberry plants were exceedingly fine with us this year, although just before the fruiting time it was unusually dry. The quality is very high. The plants are very productive, and we think very highly of them. Very truly yours,
H. J. EBUSTACE

Ohio Agricultural Experiment Station, Wooster, Ohio, July 21, 1914.

Mr. Yost:
Dear Sir,—I regret not to be able to give a very definite report on the Billy Sunday strawberry plants you sent us last year. We had a very even stand of plants in our trial plat this spring and expected to get some valuable notes, but the extremely hot weather made the varieties behave very differently from what they should have done under normal conditions. The Billy Sunday made a fair showing producing a medium sized crop of sweet, excellent flavored berries. The berries were large at the beginning of the season, but towards the last of the season ran rather small. We will be much interested in watching its behavior another year.
Very truly yours,
PAUL THAYER.

Our own experience with this variety is limited to Spring-set plants, and we can only say that it is new to us and that the plants are large and healthy, nearly rivaling our "Collins Seedling," and have considerable of the appearance of that new sort. Mr. Yost claims a long season of ripening, which is a strong point for either a market berry or for home use.

Try a few and test them yourself.
Twenty-five, 20c; hundred, $1.00.

Fendall

(Imp.)—I will give the introducer's description:

"This splendid berry originated in our garden at Towson, Baltimore County, Maryland, in the spring of 1905. It is a seedling of the well-known William Belt. Its claims to public favor are as follows: First, great vigor of plant growth. Second, large size and delicious flavor. Third, great length of bearing season. Fourth, splendid root system. Fifth, beauty and symmetry of form. The plant is strong and vigorous, clean and healthy. The berries are as large, if not larger, than any other variety grown, and unlike most large varieties in that they are of delicious flavor. In length of season it is certainly remarkable. In 1907 we picked berries from it on the 25th of May and the last on the 10th of July. With the same care and under like conditions, it produced twice as many berries as Senator Dunlap, Corsican, Glen Mary, William Belt, Marshall, and three times as many as the Gandy."

This comparatively new variety seems to have been quite successful as a "fancy berry," but like Chesapeake is a poor plant maker and we are unable to grow plants to fill our orders. However, this season we have grown a better stock than last and hope to be able to fill all orders without substitution.

Twenty-five, 20c; hundred, 60c; thousand, $3.50.
The Original Helen Davis

(Per.)—"One of the largest strawberries ever produced. Wonderful yielder and every berry smooth and well shaped. A grand strawberry. Plants are strong and healthy, a good plant maker; produce strong fruit stems and many of them. The fruit is a sight to see. We seldom find a strawberry, especially an early berry, having so many superior points as Helen Davis. "The plant is a strong, vigorous grower, with tall, healthy foliage, and has never shown any sign of disease; the runner wires are large and strong and just the right length to layer properly without crowding. The fruit stalks are large, some growing as large as a lead pencil in diameter. The fruit is held up from the ground and is easily gathered. The fruit grows in clusters, some stems having as many as thirty berries on them, with as many as ten fruit stalks to the plant. I have had single plants that a bushel basket would not cover. "One great feature of this plant is that there are never any blank plants, every plant, no matter how small, has a fruit stalk. I have never seen a plant equal it in this respect. "The fruit is large and attractive and holds up well in size throughout the season. It commences to ripen with Dunlap and ends with Sample. Have picked berries from it as late as the 4th of July. It has a light crimson color which extends clear through, and has a flavor which cannot be excelled. The berry is sweet, and is a fine berry for canning. It is a heavy cropper, and will yield twice as many perfect berries as Glen Mary. It is a perfect flowering variety, and is a strong pollinizer for imperfect varieties. "One strong point in favor of this variety is that every berry is perfect and smooth, no knotty berries. It will go through hard frosts and bear a good crop of fruit. "Every one that likes strawberries should give Helen Davis a trial, and I am sure you will be pleased."

The above is the originator's description. We have a very fine block of plants grown from stock received direct from Mr. Davis. We were able to purchase a block of this variety for the past season and owing to adverse circumstances, we did not find them as satisfactory as we had hoped. Too much rain with excessive heat made them too soft for long shipping. However, they gave us a heavy crop of large, rather light colored berries. As we have a large stock of this variety we shall offer it very low.

Twenty-five, 20c; hundred, 60c; thousand, $3.00.

Ohio Boy

(Per.)—This is a new variety originated in Ohio. As yet we have not seen it in fruit, but from others' description think it must be a good late market sort.

The originator says it is such a strong grower that it should not be planted too close, but be given plenty of room in the row. W. F. Allen of Maryland, has this to say of it: "This variety makes a strong, vigorous growth and is very productive, the season of ripening very late. We were slow to recommend this variety at first, owing to the fact that its foliage shows unmistakable relation to the Bedewood, which is a soft berry; we find, however, that the Ohio Boy has all the vigor and productiveness of the Bedewood, with the fruit much larger in size and firm enough to make an excellent shipping berry. The blossoms are perfect. Following this berry through the season, we find that it gives an immense crop of delicious berries, lasting long in the season; in fact, it is one of the latest we have, and is fine for canning."

Twenty-five, 20c; hundred, 60c; thousand, $3.50.

St. Louis

(Per.)—A new early variety that we have not fruited, so we clip these descriptions from other catalogs:

"A good grower. The fruit is large, light, bright red, nearly round, moderately firm and of good quality. The chief value of St. Louis to the grower is its earliness, ripening the bulk of berries for the early market when prices are high, while it easily stands among the largest in size of berry and with the most productive as a cropper. Should not be allowed to mat too thickly."

"The one thing that keeps this variety from first place as an extra-early berry is the fact that it is so soft, which practically makes it out of the market as a shipping berry, but, for the home table or local market, it is a good one. Originated in Arkansas by J. A. Baur. As grown here, this variety makes a very strong, healthy plant, with plenty of runners, and is productive of large berries that ripen fully as early as Excelsior or any other of the very early varieties, notwithstanding it is twice as large as the most of the very early varieties. The berries are about the same shape, and is almost as productive as Haverland; it is more productive of large berries than any other extra early sort we have ever grown."

Twenty-five, 15c; hundred, 50c; thousand, $2.50.

Testimonials

Creston, Ohio, May 3, 1915.
Dear Sir,—Received the Strawberry plants this morning all O. K. Thanks for prompt shipment.
Respectfully yours,
S. A. ANDERSON.

Miller, S. D., May 21, 1915.
Dear Sir,—The Strawberry plants came right, were in fine shape. I want to thank you for sending so many and such nice ones for one dollar. Hereafter you will get all my orders for small plants. Now, I want to get to some of those Everbearing Strawberries; if not too late will send you a dollar; take out enough to pay the parcel post, then send the rest in Everbearing Strawberry plants.
Respectfully yours,
PHIL COTTON.

Wadena, Ia., May 4, 1915.
Dear Sir,—I have received those plants today; they were in fine condition, and I am so very much pleased with them, and I am very thankful for your premium. JOHN ZUERCHER.

Lyons Falls, April 27, 1915.
Dear Sir.—We just received your bill of plants today which was sent the 23d. We telephoned the express company. They looked for them, but overlooked them in the last lot that came in. They apologized, of course, and said they overlooked them. The Blackberry bushes turned out fresh and good except a very few. We are very glad to get them looking so fine.
Respectfully yours,
J. L. SETYOUN.
EARLY VARIETIES

The Luther

(Per.)—Luther, or August Luther, as some prefer to call it, was originated by Mr. A. Luther, of Missouri, and grown by him several years before it was offered for sale. I shall still place this variety at the head of the list of extra earlies, as I have found nothing yet that I consider better. It has a very pleasing appearance, being of a very bright red color and almost always of perfect shape, a slender, rather sharp pointed berry. It ripens evenly, no "green tips," and will ripen its full crop in a very short space of time, this feature making it a good market sort. It is also a very thrifty grower, making a full row of medium sized plants.

This season we have a good stock of well-rooted plants, and I shall recommend it to all wanting very early berries.

I have dropped both Excelsior and Missionary from our list, not because they were poor varieties but rather were more especially adapted to the South than to this latitude.

As I have said before I have found nothing better than Luther for first early market berry, and I do not hesitate to recommend it as such. Twenty-five, 15c; hundred, 50c; thousand, $2.50.

Bederwood

(Per.)—This is generally conceded to be one of the very best early varieties for home use or market. It is a splendid grower, making a large number of strong runners. It has a perfect blossom, and is immensely productive. Fruit of good size, light red, medium firmness and good quality. One of the best to plant with early blooming pistillate varieties.

While this sort could hardly be classed as a firm or hard berry, it has a peculiarly dry or spongy nature which enables shipping it long distances without injury. It is an excellent plant-maker, setting freely and rooting deeply; thus being able to withstand drought. I should like to emphasize what I have said in its favor and again recommend it as a paying market sort. Twenty-five, 15c; hundred, 50c; thousand, $2.00.

Haverland

(Imp.)—This is one of the best early market sorts, and seems to do well in all sections. It makes a thrifty plant growth. Berries are large and of a peculiar longish shape, though very regular and even, holding out well to the end of the season. The color is rather light red, which may be considered a fault by some, but they make such a handsome appearance in box or basket that they nearly all sell for top price in market. About the only weak point that I have discovered in the Haverland is that the fruit stems are tall and unable to stand up under the weight of fruit as it ripens, consequently they should be mulched with straw to keep them from the dirt. This peculiarity of growth makes fine picking, as the berries lay out in sight, requiring no movement of the vines to find them. Another good point in their favor is the ability to withstand frost at blooming time, often bearing a full crop of perfect fruit when other sorts are badly damaged. There is such a demand for plants of this variety that the supply nearly always fails.

There have been a great many spurious or mixed plants sent out from this section as Haverland; we warrant ours true to name. If you are unacquainted with this sort, try a few and see what a fine market berry they are.

A little too soft for distant shipment, but they will stand picking before fully ripened and will color up in the crate after picking. If handled in this manner, Haverland will stand shipment as well as any of the larger varieties.

Twenty-five, 20c; hundred, 60c; thousand, $3.00.

Warfield

(Imp.)—This variety is still very popular as a market sort, although the Senator Dunlap has practically unseated its position at the head of the list, which it held before the advent of that very popular sort. The two together make a good team, and are quite similar in appearance when in the crate. In plant growth this variety is quite similar to Senator Dunlap, except it does not root so deep on light sandy or gravelly soils, and is more liable to suffer from drought. While the individual plants are quite small and usually have only one fruit stem, it is remarkable the number of quarts produced by a lightly matted row on good strong soil.

I feel that this variety is being overlooked in our search for something new, and I really believe it is superior to many others which we give higher praise. Warfield cannot be excelled as a canning berry, indeed, my wife says it is not equalled by any of the sorts we list. It is quite tart, but of good rich flavor, not simply sour, and has a very deep red color, which it holds after canning.

In favorable seasons and on congenial soil Warfield will yield more fruit than Senator Dunlap.

We have a good stock of fine plants of this variety and I recommend it to all.

Twenty-five, 15c; hundred, 50c; thousand, $2.00.

Lovett

(Per.)—No person need hesitate to plant this variety for either home use or market, as it succeeds generally in any soil or locality. It is one of the tough, hardy varieties that will never disappoint the grower. It has a perfect blossom and bears heavily. The fruit is medium to large size, conical, firm and of good color and quality. One of the best to use as a pollener for pistillate sorts. Twenty-five, 15c; hundred, 50c; thousand, $2.00.

A WELL PLEASED CUSTOMER

Lonsdale Farm, Pa., April 24, 1915.

Dear Sir,—The balance of plants on order No. 3391 arrived this evening in good condition, and thanks to your prompt and complete packing. I am truly thankful that your plants are every bit as good in size as an order I got last spring from a Michigan company at $6.00 per thousand.

Thanking you for your prompt attention and honest method of business with me, I am,

Yours very truly,

ALEX. SUTHERLAND, JR.
Senator Dunlap

(Per.) — In other years I have tried to describe this variety and have said that it might be called a perfect flowered Warfield. Although it is very distinct it is quite similar in form and color of berry, also in manner of production.

If grown on very strong and moist soil in matted row it will be disappointing, as we will get too many small plants, and the berries will be small and of poor quality; however, if kept in a narrow row, the fruit is large and of high quality.

I have tried for several years to get a good half tone of the Senator Dunlap, but have not been very well pleased with the result. Above is from a photo of a cluster of berries taken about the middle of the past season, too late to show the largest berries and when fruit was overripe. This illustration is true to life as showing type of berry and productiveness. The introducer of this variety had this to say of it when first offering it: "We have the greatest confidence in this variety and believe that it will in the near future take its place among the more prominent standard kinds. The plant is almost perfect in its way. We have several times called attention to its toughness and ability to endure hardships. It is small, slim, very deep-rooted, and as great a runner as the Warfield. With us it has always proven very productive. The fruit is generally large, never of the largest size, however; is conical in form, regular, never misshapen, bright or slightly dark red, very glossy, firm, a splendid keeper and shipper, most excellent in quality and one of the best canning berries we have ever known. Its season is second early and it bears a long time."

The elapse of time has fulfilled his prophecy for today there is no known variety that is so universally popular nor one that is so extensively grown as the Senator Dunlap.

Some one has said that this was the safest variety for the new beginner, as it would bear fruit in spite of neglect and ill treatment, and while this may be true in a degree, it is also true that it will well repay the most careful culture.

Another feature I wish to mention is its habit of deep-rooting. In this feature it has its superiority over the Warfield, which is a shallower rooted plant and is more easily injured by freezing or drought, while the Senator Dunlap is able to withstand either in a great degree on account of its deep roots.

I have always recommended Senator Dunlap, for either market or home use, and I wish I were able to describe its merits more fully; however, no one can make a mistake in testing it, as it is one of the best, making an excellent pollenizer for second early sorts, or doing equally well planted alone.

On the back cover of this Catalog we have a reproduction in color of this variety, which is nearer life size and gives a pretty fair representation of the Senator Dunlap when well grown. Also in our description under this cut, among other things I have said that were I confined to one variety of Strawberry Senator Dunlap would be my choice, and I wish to reaffirm or emphasize this statement here.

I do not mean to say that I think that the quality of the berry is the best of any sort, but all things considered, health and vigor of plant, its fruitfulness, good color and quality of berry, together with its long season of ripening—from early to late—make a combination hardly equalled by any other sort that we have tested.

This seems to be the universal opinion of all growers in the North Central States.
Twenty-five, 15c; hundred, 50c; thousand, $2.25.

Mixed or Surplus Plants

It sometimes happens that we have a surplus dug of some varieties of Strawberry plants and rather than hold them over for another day to get stale we should prefer to ship them out at a lower price. Also we sometimes have a few plants that are mixed in the digging (we have none growing that we are aware of) and while these would usually do as well for home use they are not fit for filling orders calling for special varieties.

These cheap plants are first-class and generally of Standard sorts; our reason for offering so low is that after being dug they soon deteriorate if held in the packing house.

If one is not particular about certain varieties, simply wanting good, standard sorts and will give your order for "Surplus" plants, we can furnish plants of our own choice for $1.50 per thousand.

We shall always send enough of Stamineate sorts to properly pollenize the imperfect varieties.
MID-SEASON TO LATE VARIETIES

Glen Mary

(Per.)—This variety was originated in Chester Co., Pa., and introduced in 1896 by W. F. Allen, of Maryland, whose description we give below:

“I introduced this variety twelve years ago at $10.00 per 100. Throughout New England and the West it is the leading berry of the list today. We sell more plants of it, year in and year out, than any variety that we grow. I do not recommend it for this peninsula, or for the South, but for New England, West and Northwest, I doubt if there is any variety that will equal it in every respect. It is only semi-staminate, but as its blossoms carry enough pollen to fruit its own berries, it is listed as a staminate variety, but I would not recommend it to plant with pistillate varieties as a pollenizer. They are big, dark red beauties, with prominent seeds of bright yellow; the meat is rich and juicy and crimson in color. They are of such high flavor that when once eaten more are wanted. As a good, firm shipper, it is very popular for fancy local market; there are few, if any, better. For this reason they are popular with both the large and small growers. It has no particular choice of soils, and does not require petting. The roots are long and well developed, providing plenty of moisture during a drought. The foliage is large, upright in growth, dark green in color, leaves nearly round, with dark, glossy surface, making a beautiful appearance in the field. The fruit stems, although large and strong, are weighted to the ground by the large clusters of berries; for this reason they should be well mulched to keep them clean. The berries are just the right size to make a fine appearance in the crate, and you do not have to be timid about asking a big price for them, as everyone will pay extra to get extra fine berries.”

Twenty-five, 20c; hundred, 60c; thousand, $3.50.

Bubach

(Imp.)—Fruit large and handsome, roundish, conical, bright scarlet, moderately firm, of fair quality. Plant a strong grower, with a large, healthy foliage and very productive. Succeeds on light or heavy soil. Desirable for home use or near market. One of the best. Season early to medium. This is an old standby, and is deservedly popular. In plant growth it is vigorous, but does not throw out excess of runners, hence it is best grown in hedge or half-matted rows.

This variety is perhaps as well known and as widely disseminated as any grown, and while perhaps it is not as popular as it was several years ago, still we always run out of stock long before the close of the season. Although it is hardly firm enough for long distance shipping, it will hold up for ordinary marketing, and is one of the largest berries grown.

Twenty-five, 20c; hundred, 60c; thousand, $3.00.

William Belt

(Per.)—“A native of Southern Ohio, and named for its originator, now deceased. For fourteen years this has been before the public, and almost from the first it took rank as the best of all in flavor. It is also superior in beauty, size and productiveness. The color is bright red. The first berry to ripen on each stem is coxcomb, but the others are conical. The plant is grand, and the foliage abundant and healthy. There was a time when it was subject to rust in some localities, but we have heard nothing of it lately.”

With us this has proven a valuable variety, giving heavy crops of fine fruit.

Twenty-five, 20c; hundred, 60c; thousand, $3.00.

Brandywine

(Per.)—This has proved so satisfactory with all who have grown it that it is consequently in large demand. It is comparatively new and of great value by reason of its productiveness, large size, beauty and good quality, which renders it especially desirable for the home garden. The berries are glossy crimson, very handsome, firm and solid, excellent in quality, with fine aromatic flavor. The berries color all over evenly and retain a good size to the last, ripening in succession, and every berry maturing fully. Plant is remarkably vigorous, hardy and exceedingly productive and its foliage is long, clean and healthy.

Twenty-five, 20c; hundred, 60c; thousand, $3.00.

Gentlemen—The Strawberry plants came last night in fine condition, and I am well pleased with them. Thanking you,

Truly yours,

LOUIS ROMMEIL.

Minneapolis, Minn., May 6, 1915.
LATE TO VERY LATE VARIETIES

Sample

(Imp.)—The introducer says: "Large size and fine quality; quite firm; continues a long time in fruit. The berries are large to the last. For the market-man it is the best strawberry ever grown. I have nothing in my grounds that will begin to fruit like it. It will yield as many berries as the Haverland, and will average as large as the Bubach. Colors all over at once. A berry that will do that is the best one yet found. There is not a weak spot in it. Foliage perfect, fruit perfect."

I feel perfectly safe in recommending this sort to my friends for either home use or market, where a late berry is desired. While we have a fair stock of plants I would advise ordering early as we always run short of Sample long before the close of the season.

Twenty-five, 20c; hundred, 60c; thousand, $3.50.

The Profitable Aroma

(Per.)—While fruit is quite similar to Gandy, the growth is very different, making fewer plants and stronger ones. The berries are large to very large, and hold up well to end of season. "It has been claimed to produce twice as much fruit as Gandy, but I would hardly think it probable, where both are grown under the same conditions. The quality of fruit is good, the color of the berry is against it where dark colored fruit is the standard of excellence, as it is more like Gandy, inclined to be light. I can personally recommend this sort to any one wanting a late market berry."

If large, bright colored berries, late in season, are an object to you, then try Aroma, and you will be pleased.

We fruited a small block of this variety the past season, although we had refused many orders, thinking we were oversold.

This block had been mulched with horse manure and most of the manure left on the ground. I think the show of fruit was equal to any that I ever saw; the berries were very large and simply lay in piles. When other varieties were selling for $1.15 to $1.25 on the Chicago market we received $1.50 for the Aroma. While I think Sample or Gandy are of better quality I believe Aroma is the most profitable sort for late market.

We have a good stock of plants and hope to be able to fill all orders this season.

Twenty-five, 20c; hundred, 60c; thousand, $3.00.

Gandy

(Per.)—Has always been popular as a late market variety; does not do well on light sandy soil, and is apt to be disappointing when planted in such location. I have no hesitation in recommending this to all as one of the best late sorts for home use or market. The only fault that I ever heard found with it was its "dry bearing" when planted on uncongenial soil.

Twenty-five, 20c; hundred, 60c; thousand, $3.00.

Stevens' Late

(Per.)—The originator describes it as follows:

"Very large, fine flavored, bright color, good shipper, a fine bed maker, a heavy yielder, fine foliage.

"It ripens later than Gandy Prize, and lasts until the Fourth of July any season. It has never shown any sign of rust. The cap, which is double, has always kept green until the last of the season."

This variety is still considered one of the best market sorts by a good many growers and I would recommend it to those growing for market.

Twenty-five, 20c; hundred, 60c; thousand, $2.00.
Raspberries

Culture—Any soil that will produce good field crops is suitable for raspberries. Pelverize the ground thoroughly and manure liberally. The red or sucker variety should be planted in rows six feet apart, with the plants three feet apart in the rows, requiring 2,400 plants per acre. The cap varieties for field culture should be planted in rows seven feet apart, with the plants three feet six inches apart in rows; requiring 1,725 plants per acre. In garden culture plant four feet apart each way.

Cuthbert

A remarkably strong, hardy variety. Stands the northern winds and southern summers equal to any. Berries very large, sometimes measuring three inches around; conical, rich erinno, very handsome, and so firm they can be shipped hundreds of miles by rail in good condition. Flavor is rich, sweet and luscious. The leading market variety for main crop. No doubt the most popular red raspberry known to fruit growers today; it certainly leads all others in points of productiveness, quality and appearance, and by long odds in acreage grown.

Twenty-five, 25c; hundred, 75c; thousand, $6.00.

Early King

This new variety is coming to the front rapidly. Among its many points of excellent are these: Extreme earliness, canes strong growing and hardy, never having winter killed since its introduction. Very prolific, bearer of large, firm and bright colored fruit.

This variety has nearly or quite taken the place of Miller Red in this section, as it is much healthier in cane, and berry is of better quality, as well as earlier in ripening.

One feature of superiority is that it does not turn dark with age as does the Cuthbert, but keeps its bright red color, although it will drop from the bushes if allowed to get over-ripe; this requires frequent picking. I would recommend this as the best early Red Raspberry grown. As we have a large stock for coming spring we have reduced the price.

Twenty-five, 25c; hundred, 75c; thousand, $6.00.

Ranere, or St. Regis Everbearing

This variety has been grown in New Jersey for several years by a colony of Italian gardeners and by them called Ranere. A few years ago J. T. Lovett put it on the market, calling it “St. Regis.” It is a sure-enough “everbearer,” for after the fruiting canes finish their crop in summer it begins to bear on the tips of the new canes and with favorable weather it will ripen quite a “Fall crop,” continuing till killed by frosts. These same new canes living through the winter and bearing heavy crop during the next summer. In its original location it is considered profitable as a market sort, being one of the earliest to ripen. It is also very hardy, having withstood the coldest winters without injury.

We have a nice lot of plants of this variety of our own growing that we can warrant genuine and we would advise all to test it as we think it has merit, judging from the demand for plants, which increases each season.

Twenty-five, 50c; hundred, $1.75; thousand, $15.00.
BLACK OR CAP VARIETIES

Plum Farmer

"This grand blackcap raspberry was found by us in a lot of blackcap plants received from Ohio some years ago. We have fruited it and sold plants from it for nearly fifteen years, and in all this time, while we have tried numerous varieties, we never have seen anything that could near approach it in value. The plants are fine growers, being more free from diseases of blackcaps than other varieties; are clean silvery blush in appearance when ripened in the fall, and when loaded in fruit are a sight to behold. It ripens very early and most of the fruit is produced in one week. It will outyield any blackcap we have ever seen. The fruit is very large, thick meated and very firm, making a good berry to evaporate or ship to distant markets."—L. J. Farmer.

We have fruited this and find that it is easily the best early blackcap we have growing today. Cane is healthy and strong growing, has many laterals, thus giving lots of bearing wood, insuring its heavy bearing, while the berry is very large and of fine quality.

Twenty-five, 35c; hundred, $1.25; thousand, $9.00.

Cumberland

This has been named the "Business Blackcap" by the introducers, and has been loudly praised by all who have grown it. It is a very large berry of fine flavor, rich and sweet, and of jet black color with slight bloom. The cane is of extreme hardiness, very strong growing and free from anthracnose.

It is a mid-season variety following the early sorts, but ripening ahead of Gregg.

Without doubt this is the most popular Black Raspberry grown today, there being perhaps twice the acreage set to Cumberland in this locality of any other sort.

Twenty-five, 30c; hundred, $1.00; thousand, $8.00.

Gregg

My experience is that Gregg is quite hardy on well drained soil, but does not love wet feet and winterkills badly on wet ground. The berries are covered with a whitish blue bloom, which in its first dissemination was mistaken for mould or mildew and hindered the sale of fruit on the market; but since becoming better known, this sort is very popular in all sections, and I do not hesitate to class it as the best late market sort.

Twenty-five, 30c; hundred, $1.00; thousand, $9.00.

Dear Sirs: Brownsburg, Ind., June 7, 1915.
The Strawberry plants were duly received and were in good shape. They are growing nicely and we thank you for your prompt delivery.

Yours truly,

CHAS. B. BRALTON.
**Royal Purple**

Originated in Indiana with a grower who says: "It surpasses anything I have ever seen in the Raspberry line. The original bush stands in a stiff blue-grass sod and has borne thirteen successive crops, and some of the time in winter the mercury has gone 35 degrees below zero. The bush is of healthy growth, and the fruit is of large size." The canes are model growers, vigorous and healthy, and the color of the bark is a deep, rich red, being smooth except near the roots. The berries are purple in color, good shippers and good keepers; they do not crumble when picked. The bulk of the crop comes about two weeks later than Columbian.

Twenty-five, 50c; hundred, $1.75; thousand, $15.00.

**Columbian**

The Columbian is a variety of the Shaffer type, of remarkable vigor and productiveness. It is hardy and propagates from tips. Fruit very large, often an inch in diameter, shape somewhat conical, color dark red, bordering on purple; adheres firmly to the stem and will dry on bush if not picked; seeds small and deeply imbedded in a rich, juicy pulp with a distinct flavor of its own, making it a most delicious table berry. In my estimation this is the most valuable purple cap yet produced, as it is more hardy, earlier and certainly more prolific, and fruit of larger size than any other sort I am acquainted with.

Twenty-five, 50c; hundred, $1.50; thousand, $12.00.

**Dewberries**

**Lucretia**

This is counted as the standard of all Dewberries, is earlier than the earliest blackberry and as large as the largest of them. The canes are of great hardiness and exceedingly prolific, thriving everywhere, of slender, trailing habit and entirely free from disease and insect attacks. The fruit is large and handsome, jet black, rich and melting; ships well and keeps well.

Twenty-five, 35c; hundred, $1.25; thousand, $10.00.

**Black Diamond**

**Star, Wonder, Atlantic Dewberry**; also several other names for this same variety, which the first year grows with the trailing habit of a Dewberry and increases from the tip.

This variety is claimed to be a descendant of the old Evergreen Blackberry of the Pacific Northwest, and its manner of growth is similar to the Himalaya, although superior to that much vaunted sort, both in yield and size of fruit.

Our experience has been with first year planting and we can say very little for or against; the few berries that we saw ripened very late and were small, although sweet and palatable. I will add clippings from several other catalogs:

"The Black Diamond Blackberry was originated some years ago by George H. Liepe from the seed of the old Evergreen, a variety of the Cut Leaf class of Blackberries. The plants are very vigorous and stocky, thus enabling them to carry to maturity their immense loads of perfect fruit. The foliage remains remarkably green till late in autumn. It is also free from rust and is not troubled with borers or rose scale."

"The Ewing Wonder Blackberry is all its name implies and exceeds in productiveness the most sanguine expectations. When the promoter first told us of its growth and yield, we were decidedly skeptical and thought he was romancing. A visit to the farm and to the blackberry field and inquiries made among the neighbors dissipated all doubts."

"The berry is of medium size, compact in structure and of the finest flavor. It grows in clusters, something like grapes. Thirty-eight quarts have been picked from a two-year-old plant and greater yields have been reported."

"It can be grown upon an arbor as grapes are grown, producing a pleasing appearance and yielding enormous crops when thus treated, but I have found a much more convenient and equally successful method is to plant six feet apart each way and tie the canes to stout stakes. The canes do not die back each season, as do the ordinary Blackberry, but live on from year to year like climbing Roses and Grapes."—Statement of Sec. State Board of Agriculture, New Jersey.

Twenty-five, 35c; hundred, $1.25; thousand, $10.00.
Blackberries

Blackberries should be planted in rows six or seven feet apart and three to five feet in the rows. Keep the ground light and rich. Pinch the canes back when they have reached the height of from two to three feet.

Our Blackberry plants are strong "Sucker" plants with good cross roots and are first class.

The Productive Ward

Undoubtedly a seedling of the Kittatinny, which it resembles, having all of its good qualities and none of its defects. Healthy, strong grower with sturdy canes producing fine large fruit, black throughout, without core and of excellent quality. Have never suffered from winter injury in New Jersey. An exceedingly prolific sort, the bushes being covered with its fine fruit, producing as many bushels per acre as the Wilson in its prime.

This is a new variety that we listed two years ago for the first time, although I have fruited it several seasons. I find that it proves quite hardy in bud and cane, withstanding our winters without protection.

To those who remember the old Kittatinny, this will prove an acceptable variety, as it is much like that sort in manner of growth and in quality of berry, while it is not troubled with "orange rust," which has practically destroyed the Kittatinny.

I shall have to qualify the above statement, which was our last season's description, a little, for we noticed some canes in our older block of this variety, showing unmistakable signs of rust the past year.

The only "cure" we know for this disease is to pull out and burn all affected hills. If one watches closely and is careful in this, I think this variety can be kept free for several years, or for as long as any block should be kept in fruit without renewing.

Twenty-five, 40c; hundred, $1.50; thousand, $12.50.

Eldorado

In other years I have headed our list with Eldorado, but this time I am going to give it second place, as I think Ward is fully as good a berry in every way, and much more productive.

However, I do not mean to infer that Eldorado is not a first-class variety. For years it has been a standard of excellence in all points, with us; superior quality, large size, hardiness of bud and cane, sells well in market as it is jet black and holds its color well, berry large and juicy, without core, entire freedom from Orange Rust, and a prolific bearer.

What more can we say? Try it yourselves, giving it a good strong soil, full of humus; prune and cultivate properly and my word for it, you will be pleased.

Twenty-five, 40c; hundred, $1.50; thousand, $12.

Grape Vines

The grape is one of the easiest fruits to grow and should be in all collections. When once well established, vines will continue in bearing a long time with very little care, other than the cutting back of the extra growth, which should be done in winter or very early spring (before sap starts to circulate). This pruning is essential to the healthy growth of the vine and its fruitfulness. The grape is fast becoming a leading fruit in our section of Michigan, and there is no reason why it should not be grown in many other sections of our country. With such hardy varieties as Concord, Worden and Niagara, no one need be without at least a few for the home use, as the vines can be taken off the trellis for the winter, and if covered lightly with some kind of mulch will stand the extremes of our northern climates.

Niagara (White)—Vine hardy, an unusually strong grower; bunches very large and compact, sometimes shouldered; berries as large or larger than Concord; mostly round, light greenish white; semi-transparent, slightly amber in sun, skin thick but tough, and does not crack; quality good; very little pulp, melting and sweet to the center.

First-class one-year plants: Dozen, 75c; hundred, $4.00.

Concord—A large, purplish, black grape, ripening about the middle of September; vines remarkably vigorous and free from disease; the standard for productiveness and hardiness all over the country. One-year, No. 1: Dozen, 50c; hundred, $2.50.

Worden—A splendid, large grape of the Concord type, but earlier, larger in bunch and berry, and of a decidedly better quality; vine hardier than that old standby and every way as healthy. A very popular sort, planted largely for the market; next to Concord in number used.

Fine one-year plants: Dozen, 60c; hundred, $3.50.

Moore's Early—A black grape. Bunch large, berry round, quality better than the Concord; vine exceedingly hardy. Its earliness makes it desirable for an early crop, and more particularly adapts it for New England and the northern portion of the United States, maturing as it does ten days before the Hartford and twenty days before the Concord.

No. 1, one-year: Dozen, 75c; hundred, $4.00.

Brighton (Red)—Perhaps the best red grape in cultivation. Bunch large and compact, a strong grower and very productive; quality good.

Fine one-year plants: Dozen, 75c; hundred, $4.00.
Currants

A cool, moist location is best for this fruit, and for this reason succeeds admirably when planted by a stone wall or fence; being benefitted by partial shade. Plant in rows four feet apart, and the plants three feet apart in the rows. Keep the ground mellow and free from weeds and grass, using fertilizer copiously. Mulching is necessary for the best returns.

Perfection—This new currant was originated by C. G. Hooker, of New York State, by crossing the Fay’s Prolific with the White Grape Currant. It has the large size of the Fay, with the extra good quality and great productiveness of the White Grape. The color is beautiful bright red, and is less acid and of better quality than any other large currant in cultivation. Perfectly healthy, and a vigorous grower, and in fact the best currant for home use or market purposes under cultivation today. It has received a great many testimonials from the highest sources in this country. I think all who want a fancy fruit of this sort will do well to try a few. Two-year plants. Twelve, $1.25; hundred, $9.00.

Wilder—A remarkable variety, for which we predict great popularity, both for table and market. One of the strongest growers and most productive. Bunch and berries very large, bright attractive red color, even when dead ripe; hangs on bushes in fine condition for handling as late as any known variety. Compared with the celebrated Fays is equal in size, with longer bunch, better in quality, with much less acidity; ripens at same time, continues on bush much longer; fully as prolific, in some trials largely outyielding it. Recommended by our Experiment Station as the best red currant. Strong plants. Dozen, 75c; hundred, $4.50.

London Market—Of English origin. As compared with Victoria, it is larger, more productive, much stronger, less infested with borers, and retains its foliage until frost comes. It has produced twice the amount of fruit the Victoria did under the same conditions; a very strong and upright grower. Strong plants. Dozen, 75c; hundred, $4.00.

White Grape—Very large, yellowish white, sweet or very mild acid; excellent quality and valuable for the table. The finest of the white sorts. Dozen, 90c; hundred, $5.00.

Lee’s Prolific (Black)—This is the leading variety of the black currant. Very heavy bearer of large bunches of fruit. Extra quality. Valuable for home use. Dozen, 90c; hundred, $5.00.

Gooseberries

The same soil and conditions best adapted to currants will be appropriate for gooseberry culture. The American varieties of gooseberries are among our hardest plants. All of the standard sorts of the present day are cultivated forms of a native species natural to the upper Mississippi Valley, and in this region the cultivated sorts seem to reach their highest development. Clean culture should be given until the plants are well established, usually about the third year; after this they may be permanently mulched. As the best fruit is borne on the two and three-year-old wood, a certain amount of pruning will be necessary to encourage a strong growth of canes and in the removal of the older wood after bearing.

Downing—This is without doubt the best gooseberry for general cultivation that is offered today. It is an American or Native seedling, not an English sort. The latter are very hard to grow successfully in this climate on account of weak foliage which is very susceptible to mildew.

When this disease attacks the gooseberry it causes the foliage to drop before the berries are fully grown and materially injures the crop. Downing is a yellowish-green sort, and of good size, being a strong growing bush and a very prolific bearer. Plants of all varieties of gooseberries are in light supply and in very good demand, and the price is high.

Dozen, $1.25; twenty-five, $2.50; hundred, $5.00.

Houghton—An enormously productive and always reliable old sort; of vigorous, yet rather slender, spreading growth, not subject to mildew. Berries of medium size, smooth, pale red; tender and good.

Dozen, $1.25; twenty-five, $2.00; hundred, $7.00.
Perennial Phlox

We still have a fine lot of this flowering plant which is being much used for background or border of lawn or home grounds. It is very easy to grow, requiring little care or attention after first year, if given a reasonably good soil or location.

Our stock consists of mixed Seedlings of blooming age, grown from an original bed of twelve choice named varieties, covering the different shades from Salmon Pink to very Dark Red, also including Pure White and White with Marking of Red.

These Seedlings are mixed as they grow and I cannot furnish special color, but will guarantee that in a dozen or more of the plants you will have a good assortment and that you will not be disappointed in the colors.

I am showing a plain cut of this flower which does not show its beauty, but will give an idea of its appearance and manner of growth.

We are offering it as a premium with orders (see page 20). Regular sale price, 5c each; 50c per dozen, or $1.00 per twenty-five.

Asparagus Roots

When planting asparagus roots, set four to six inches deep, and about 12 inches apart in the row, covering with only three inches of soil at first, and filling in the trenches as the plants grow. The asparagus bed is apt to be neglected in the early fall. Before the 1st of September the tops should be cut, and the bed or field cleared of weeds. It is highly important that all the seeds should be taken off, as the greatest enemy asparagus has in the way of weeds is asparagus, and it is almost impossible to get clear of superfluous plants, when once established. When this work is finished, cover the bed to a depth of three inches with coarse manure, which will not only enrich the soil, but will keep out the frost, which is highly essential.

The first work in the spring should be to remove all the covering except the fine manure which should be carefully forked in, so that the crowns will not be injured by the tines of the fork. Forking the beds should not be neglected, as the early admission of the sun and rain into the ground induces the plants to throw up shoots of superior size. Another step in the right direction is to keep the ground entirely free from weeds the entire season, as these take from the plants the strength required for their own growth and the asparagus needs it all.

Palmetto—A valuable new variety and is being planted very largely. It is nearly twice the size of Conover, fully as early, and as productive. The flavor is excellent. Hundred, 75c; thousand, $5.00.

Giant Argenteuil—This variety is largely grown in France, but has become adapted to our soil and climate. It is noted for its earliness, productiveness and immense size of stalks. Remarkably healthy. Hundred, 75c; thousand, $5.90.

Rhubarb or Pie Plant

This deserves to be ranked among the best early products of the garden. It affords the earliest material for fine pies and fresh table sauce, continues long in use, and is valuable for canning. Make the ground rich and deep, as recommended for asparagus. Plant four feet each way.

Myatt's Linnacus—Those who have never grown this variety, which is of superior quality, will hardly recognize the old "Pie Plant." It is an early, tender variety, without being in the least tough or stringy, with a mild, sub-acid flavor.

Good strong roots, 5 cents each; dozen, 50c; hundred, $4.00.
Instructions to Purchaser

Read over very carefully before making out your order. Use the order sheet inclosed and sign your name very plainly just giving Post Office, County and State.

My Location—I am located in Southwestern Michigan, about fifteen miles south of St. Joseph, near Lake Michigan, in what is known as the "Great Fruit Belt."

Railroad Connections are good. Our line of road, the Pere Marquette, runs mail and express trains direct to Chicago, some three hours. Within fifty miles this line connect with the great trunk lines, east, west, north and south.

Telephones—Long distance telephones in our office.

Parcel Post—We are now able to ship plants by Parcel Post, and within the nearer zones it is the cheaper method.

Within the First and Second zones, which cover 150 miles, the limit of weight is fifty pounds, while in all other zones the limit is twenty pounds.

With the varying zone rates and the uncertainty of weights it is practically impossible to tell in advance what the cost of transportation of each shipment will be, therefore we find it best to send plants C. O. D. for Parcel Post charges.

This costs an extra 16 cents, but it is also an insurance, as these C. O. D. packages have to be recipted for, and are reasonably sure of reaching their destination, while many packages sent in open mail do not.

Where our customers live on R. R. routes with Parcel Post delivered at their doors, which is so much more convenient than having to go perhaps several miles to the express office, that to accommodate such we are willing to send in the manner described above.

However, I frankly admit that considering the perishable nature of plants, I believe that express shipment is the safest and cheapest in the end, although it may cost a little more. I much prefer express shipments, and am willing to decline any large orders to be shipped by mail.

By Express—This is the safest way to ship live plants, as it makes fast time with the least liability of delay. Sometimes when transferred to another company the charges seem rather high, but when the nature of the service is considered it is really the cheapest in the end.

We have only the Adams Express Company; however, we find little difficulty of many customers by this company, and its connections. Under new ruling of Interstate commerce express companies bill to destination even if there are two or more companies, making a charge on small packages.

Freight—Early in the season I can ship by freight with comparative safety, but there is a possibility of delay and consequent loss. Parties ordering stock shipped by freight will have to take the risk, as I cannot be responsible for loss, if any, on stock shipped in this manner.

Loss or Damage—If packages are broken or damaged upon arrival, or have been an unreasonable time enroute, our patrons should refuse to accept and pay charges on the same, but should place claim for their value at once with the agent at their end of the line.

Safe Arrival—I do not undertake to guarantee safe arrival by any of these modes of transportation, as I have no control of stock after it leaves my hands; however, it is to my interest, as well as the interest of my customers, to have stock reach the purchaser in good condition, and I shall always endeavor to so pack and forward goods that they may prove satisfactory.

My Packing is done in the best possible manner and under my personal care. I use light crates or baskets with plenty of paper for packing strawberry plants, and barrels and boxes for other sorts, making no charge for the work or package. My long experience in this line gives me a decided advantage in the matter of safe packing. I also have experienced help who have worked with me several years. Of course, we do not claim infallibility, and are always ready to make repARATION where at fault.

Shipping Season begins about April 1st, or possibly last week in March, and continues until about 1st to 10th of May, according as the season is early or late.

Terms—One-fourth cash with order, balance before stock is shipped. Or I will ship C. O. D. if one-half of the amount accompanies the order and purchaser will agree to pay the balance before the stock is shipped. Remittances may be made either by New York or Chicago draft, postoffice or express order, or where none of these may be had, by registered letter.

Rates—Fifty cents per hundred plants of one variety at hundred rate; or three hundred plants of one variety at thousand rates. When an order amounts to $10.00 or over, it may be counted at the thousand rate, regardless of number taken. If an order booked for less than $10.00 is placed.

My Prices as a general thing are very low, but on large lists we are sometimes able to give better rates and invite all wanting large lots to write for estimates.

By large list I mean a quantity; ten to twenty thousand and up.

Order Blanks—Use the order blank enclosed when ordering, being careful to write your name plainly, giving Postoffice, County and State, and do this every time you write. Also keep a copy of your order yourself. Be particular to say how goods are to be sent, whether by mail, express or freight. All orders are acknowledged immediately upon receipt. If you do not receive an acknowledgment in a reasonable time, write again.

When to Order—Early, by all means. The rule generally is "First come, first served," also the early orders find full the return charges on the money.

Our customers will please remember that the time for filling orders is short, and it would facilitate our work greatly if orders were sent in before the rush.

Premium Offer—On all orders at catalog rates received during January and February with cash in full, I will allow a cash discount of 5 per cent, or for every dollar sent during these months a discount of 25 cents for every order additional stock to the amount of ten cents.

Substitution—In ordering please state whether I shall substitute some other variety in case the kind ordered should be exhausted. If not forbidden I claim the right to substitute something of equal value, but always label true to name. I always aim to substitute sort similar in quality and season and always something listed at equal or higher rate.

Guarantee and Condition of Sale—While I take great pains to have stock true to name and hold myself ready upon proper proof to refund money or replace any that proves untrue, it is mutually agreed that I shall not be liable for a greater sum than the amount paid for such stock.

Every order received for articles named in this cata-

log will be received and executed on the above conditions only, and with the distinct understanding and agreement on the part of the purchaser that I shall in no case be liable for a greater amount than the sum originally paid to me for the stock in question.

References—I refer to the Adams Express Agent or Postmaster at Bridgman; Union Banking Company, St. Joseph; or Bradstreet's Commercial Reports, as to my standing and reliability. Please write the name of any one of the above, please enclose stamp for reply.
# Price List for 1916

## Strawberry Plants

If by mail, see Parcel Post rates on page 19. At thousand rates, by express or freight only. Fifty of one variety at hundred, or 300 of one variety, at thousand rates.

## Premium Offers

With a $2.00 order for other plants at catalogue rates I will include Six Perennial Phlox Plants, or Fifteen with a $5.00 order.

With an order amounting to $2.50 I will include 10 Fall-bearing Strawberry plants or with a $5.00 order I will include 25 plants; with a $10.00 order you may add 50 of either Superb or Progressive.

With an order amounting to $2.00 I will include 10 Collins Strawberry plants; with a $5.00 order, 30 Collins; or 100 with a $10.00 order.

With an order amounting to $10.00 or more I will include one year's subscription to The Garden Magazine. As its name indicates it is devoted to the interests of the garden and farm. Each issue has excellent articles from able writers, and is well worth the subscription price of $1.50.

On all orders amounting to $5.00 or more you may add 10 per cent in stock from the list. Please Note. These Premium Offers must be mentioned when the order is sent; also that in either of these offers the amount must be figured at the Catalog price per thousand and not the five thousand rate, nor where a special price has been quoted; also only one premium with each order.

---

**C. E. WHITTEN'S NURSERIES**

Bridgman, Mich.

A. B. Morse Company, St. Joseph, Michigan
This variety we offered to the public last season for the first, selling only in a limited way. This year we have a good stock of plants and shall offer it at so low a price that all can afford to test it. I will give part of last year's description:

"In offering this new Strawberry at this time I feel that I have something that will be an acquisition to our list of market sorts, and is also of such superior quality that the amateur will be delighted with it. Now let me say something of its origin: back in 1909 my next door neighbor, a Mr. C. H. Collins, (an old soldier of the '60's by the way) planted seed from a fine appearing berry picked from a Bederwood plant, saving three plants from these seedlings. Our berry was one of these and I saw it fruiting in 1911, and have had it under observation each year since. While its direct parentage (Bederwood) was plebeian it must have had blue blood from some other source, for the plant growth, while showing unmistakable features of Bederwood type, still is of much stronger growth, making a good row, but it is not the excessive runner that Bederwood is; the foliage stands up very strong and rank, of rich dark green color, and is free from rust or disease."

The fruit stems are strong, holding the berries well up from the soil, also the berries are of much better color than Bederwood, being a deep red, and of good rich flavor, ripening evenly without green tips.

The "Collins" is strongly staminate, making it a good pollenizer for pistillate sorts. While we shall call it a mid-season variety, it covers so long a period of ripening that it really begins with the second earlies and continues well along with the latest sorts, bringing practically every berry to perfection.

We fruited quite a block of this variety the past season, and although badly injured by frost in the early blooming, the plants continued to throw out new fruit stems and we finally picked a heavy crop late in the season; in fact we picked our last good berries from the "Collins" after the Aroma were done.

For further description and prices of this variety see inside pages of this catalogue.
The above photograph in colors is from a cluster of berries taken from our rows which had been given only ordinary field culture, and rather late in the season, after the first large berries were picked; however it shows the general appearance, shape and prolificness of the variety.

I have no hesitancy in saying that if I was confined to one variety this would be my choice. When properly grown it is of excellent quality, a strong grower and prolific bearer.

Without doubt there are more acres of this variety growing in the Central and Northern States than of any two other sorts.

It should be grown on strong soil, but the plants should not be allowed to mat too thickly, hence a large part of the runners should be removed as they form.

Given an open row where sun and air can reach the berries, this variety is sure to please, as it is a very heavy bearer of deep red fruit of handsome appearance and best quality. It is a long season variety, commencing with the second earlies and lasting well towards the end of the season.

I know that some growers condemn this sort as unreliable, and of poor quality, but I think the reason for this is that they have allowed the plants to make too heavy a matted row, consequently the sun cannot get in to properly ripen the fruit; and if wet weather comes the berries are soft and inferior.

When grown under best conditions it is hard to beat. In other years we have said that it might be called a perfect flowered Warfield, as it resembles that variety in appearance of fruit very much, and being a strong pollenizer it makes a good mate to set with Warfield.

I will stake my reputation as a successful Strawberry grower and an honest man on this variety, for either home use or for a market sort. Try it, you will not regret it if you give it the treatment that I have suggested.

For further description and price, see inside pages of this catalog.
